## PART V THE ACCIDENT

1/IT G. W. G. SMITH, USMC and his RIO, LT C. H. GUERNSEY were scheduled for a high altitude tactics familiarization flight from NAS Miramar to be flown wearing a pressure suit. Scheduled launch time was 1330. The flight profile called for a CRT take off and subsequent climb to 38,000 feet and a high mach dash run terminating in a thirty degree nose high snap up maneuver, going over the top at some altitude above 50,000 feet. The flight was briefed by a staff instructor, LT (b) (6) who devoted the majority of the brief to the projected pressure suit enviorment in order to ensure that 1st LT SMITH was fully prepared for this, his first pressure suit flight. IT GUERNSEY is a staff RIO instructor and is experienced in the use of the pressure suit. The pilot and RIO recieved a practical review of the pressure suit from squadron rigger personnel while dressing for the flight. No apparent unusual difficulties were in evidence while the crew was manning their aircraft. Both pilot and RIO made pressure suit oxygen system functional checks while being strapped in. All checks were satisfactory. Following completion of starting and post start checks, 1st LT SMITH taxied his plane to the high power turn-up area. It was noticed that he had, for reasons unknown raised his clear visor prior to taxi. At the high power turn up area lst LT SMITH questioned his RIO stating he could move the clear visor freely although he had reportedly turned on his oxygen regulator. IT GUERNSEY informed him that this was not normal and that he should check his upper block, reguator, and other fittings for security. Momentarily, lst LT SMITH reported his oxygen restored, visor sealed and upper block and exhaust hose checked. The flight clear d for take off and a high performance (SCAMP) instrument departure, became airborne at 1408T. Squadron procedures call for dumping cabin pressure at 10,000 feet while climbing as part of the pressure suit controller functional check and noting its operation above 35,000 feet. Upon completion of this check, cabin pressurization is to be restored. 1st LT SMITH forgot to dump cabin pressure passing 10,000 feet, but remembered and commented upon it to his RIO passing 30,000 feet, stating he was going to accomplish it at that time. IT GUERNSEY reported his suit inflation normal and recieved an affirmative response from 1st LT SMITH regarding his own suit operation. This was the last coherent response recieved from the pilot. LT GUERNSEY subsequently instructed lst LT SMITH to repressurize the cabin, passing 41,000 feet but he failed to respond. About 15 to 20 seconds following the dumping of cabin pressure LT GUERNSEY noted the the nose attitude of the aircraft began to wander in an erratic manner. Approximately 5 minutes had elapsed since take off. He repeatedly tried to gain a response from the pilot without success other than a possible groan heard over the hot mike ICS. Recognizing the seriousness of the situation, IT GUERNSEY broadcast a distress call, stating his position to the controller at FAANTC (who was to monitor the dash run on radar), and en repeated the call on UHF guard frequency, stating his intentions to eject. During this time the changes in attitude of the aircraft became more and more diverse with speeds varying from close to supersonic to very slow. If GUERNSEY believes the altitude to have been about 35,000 feet, speed about 200 knots mose high, with CRT still selected he ejected. All mergency erress systems functioned normally, the only unusual occurrance

SPECIAL HANDLING REQUIRED IN ACCORDANCE WITH PARA 66 OF OPNAV INST 3750.6E

being the shattering of LT GUERNSEY'S clear visor after seat separation. This is believed to have been caused by the drogue gun projectile striking it during descent. LT GUERNSEY saw the aircraft only once following it during descent. LT GUERNSEY saw the aircraft only once following ejection at which time it was several hundred feet below him, in a nose low attitude, right wing down in about 90 degrees of bank. The aircraft crashed into the sea within ten miles of the point where LT GUERNSEY was picked up by a NAVY helicopter.

## PART VI DAMAGE TO AIRCRAFT

BUNO 151005 sustained strike damage and was lost at sea as a result of collision with the water. Bits of wreckage picked up by SAR surface units included pieces of trailing edge surfaces from wings and stabilator, bits of honeycomb, the LOX converter, two high pressure air bottles out of the nose section of the aircraft, a portion of the pilot's headrest the pilot's drogue chute and partially inflated, but torn life raft, foam rubber inner seat cushion from the pilots seat pan, the pilot float valve from the center line tank, and a piece of shackle bracket from a wing station. The wire binding on the outer surface of the high pressure air bottles was completely stripped away. The LOX converter was badly battered and broken in several places. The trailing edges of the aircraft surfaces picked up were not distorted to any great extent and there was only minor scraping and a few small holes on the under sides, indicating probable tearing from leading edge aft, then final failure and breaking up. The RIO's raft, seat pan and survival gear were picked up in the condition he left them when he was rescued by the helicopter.
